

NEXORA — Implementation Roadmap

Website only · FE / BE / Nav per screen · 12 items + suggested build order

1. Home page

- FE** designed banners for remaining hero slides (US election, Iran), Live Markets section under the hero ("Trading now" + "Closing soon" horizontal strips), skeleton/empty/error states.
 - BE** SSE feed pushing realtime price + volume + 24h trend into the market cards.
 - Nav** hero CTAs → correct `/?category=` filter, market cards → `/market/[id]`.
-

2. Market detail (Bet) screen — biggest build

- FE** price chart, YES/NO order panel, size input, slippage/fees display, position summary, comments, related markets, trade confirmation + error toasts.
 - BE** GET market detail, POST trade through existing AMM, position writes, comments endpoints.
 - Nav** every market card → `/market/[id]`; after trade → portfolio updates instantly via SSE.
-

3. Trending page

- FE** filterable + sortable list (volume / 24h change / recently launched), infinite scroll.
 - BE** GET `/trending` with sort, filter, pagination.
 - Nav** hero "Trending" card + LeftRail "Trending" → `/trending`; rows → `/market/[id]`.
-

4. Portfolio page

- FE** open-positions table, P&L summary, trade history, claim button for resolved wins.
 - BE** GET `/portfolio` (positions + history + P&L), POST `/claim`.
 - Nav** LeftRail "Portfolio" → `/portfolio`; rows → `/market/[id]`.
-

5. Wallet page

- FE** balance card, deposit flow (you've started), withdraw flow, transaction history.
 - BE** GET balance + transactions, POST deposit address, POST withdraw.
 - Nav** Navbar "Wallet" button + LeftRail "Wallet" → `/wallet`; subroute `/wallet/deposit`.
-

6. Profile page

FE	username, avatar, stats (win rate, P&L, trade count, badges), public/private toggle, shareable link.
BE	GET /profile/me, GET /u/[username] for public, PATCH for edits.
Nav	AccountDrawer + LeftRail "Profile" → /profile; public via /u/[username].

7. Search modal

FE	fuzzy results grouped (markets / categories / users), recent-searches in localStorage, keyboard nav.
BE	GET /search?q=.
Nav	Navbar icon + / + Cmd-K already trigger it; result click → relevant page.

8. Notifications

FE	dropdown content (you have the shell), full /notifications page, mark-read / mark-all-read.
BE	GET /notifications, PATCH read state, push via existing SSE on trade.executed / market.resolved / payout.
Nav	Bell → dropdown; "View all" → /notifications; each item → relevant market/trade.

9. Settings sub-pages

FE	/settings (general), /settings/notifications (channel prefs), /settings/security (password, 2FA, sessions), /settings/currency.
BE	GET/PATCH user prefs.
Nav	AccountDrawer + LeftRail "Settings" → /settings; LeftRail "Notifications" → /settings/notifications.

10. Auth screens

FE	signin + signup matched to new design (started), forgot-password flow.
BE	already wired via NextAuth — no work.
Nav	signed-out clicks on Wallet/Bell route to /auth/signin (done); from signin → signup link.

11. Leaderboard

FE	top traders by P&L / volume / win-rate, weekly + all-time toggle, "your rank" callout.
BE	GET /leaderboard?timeframe=.
Nav	already in Navbar pill; rows → /u/[username].

12. Smart contracts — deferred — needs Solidity engineer

USDC custody, on-chain settlement, fee router. Ship centralized first; migrate later.

Build order

What I'd suggest, top to bottom:

1. **Realtime SSE pipeline** — cuts across home, trending, portfolio, bet screen. Land this first or every screen looks dead.
2. **Bet screen** — core loop, where users actually trade.
3. **Home Live Markets section** — gives the hero somewhere to lead into.
4. **Portfolio** → **Wallet** — closing the trade loop (place trade → see position → manage funds).
5. **Trending** → **Profile** → **Leaderboard** — discovery + identity.
6. **Search** → **Notifications** → **Settings** → **Auth polish** — final polish.
7. **Smart contracts** — last.
